Let us give you a quick explanation. A VPN is a software application that allows you to connect to a private network. These networks are usually built by companies that want to provide their customers with complete privacy. They are usually connected through tunneling protocols to encrypt your data to ensure that it stays private. This is also referred to as hiding your data. There are mainly three different types of VPNs: OpenVPN, PPTP and IPSec. OpenVPN is an Open Source software application that is mainly used for connecting to a private network. The VPN is usually run on a server that a user is connected to and it is usually supplied as a public service by the VPN provider. PPTP is a standard that is developed by Microsoft and is used mainly by corporations. It is a very safe and easy to use program that can be used to create a VPN. IPSec is a standard that is developed by the IETF and it is mainly used by corporations. It is a very secure and safe VPN that also allows you to establish a VPN connection over your normal Internet connection. The main difference between PPTP and IPSec is that PPTP usually uses 128bit encryption, but IPSec allows for 256 bit encryption. Some of the reasons why you would want to connect to a VPN are: - You want to protect your privacy - You want to access geo restricted sites - You want to connect to a private network - You want to unblock a public network. Who uses VPNs? The main users of VPNs are people who are interested in privacy. A good example of a company who uses VPNs is the NSA who uses the VPN to secure their connections to the public Internet. They are known to
